

LPR 2

Visibility of system status (1-10): 9

This is not shown in the demo video, but there wasn't indication on which page the user was on.

Match between system and the real world: 10

Pages are clearly named, the UI is pretty trivial.

User control and freedom: 10

The page is simple. Simple enough to rely on the back button supplied by the browser used to view the page. User can't get lost anywhere.

Consistency and standards: 10

Simple design, everything you want to search for is easily available to you on the page.

Error prevention: 10

There are not much functionality on your page. Not much that the user can do, including errors.

Recognition rather than recall: 10

Everything the site is to offer is presented to the user at all times.

Flexibility and efficiency of use: 10

Can't see any way to make it more efficient. Ability to navigate using keyboard is supplied by the browser, but general support for keyboard navigation would make it more efficient to use.

Aesthetic and minimalist design: 3

It is simple, but with the monospace font, very 90's gradient across the whole page, it looks very stale and outdated. Also there is this wall of text presented immediately to the user, which just isn't very elegant.

Help users recognize, diagnose, and recover from errors: 10

There are no errors for users to make.

Help and documentation: 10

No need for documentation of any kind.
